

Business Resiliency as a Service

BRaaS

CEO decision framework for compound business disruptions
across critical infrastructure

Resiliency gap

Technical resiliency — CISO / CTO

Cyber • System outages • Network security • IT DR

Business resiliency — CEO

Infrastructure failure • Financial crisis • Regulatory enforcement • Reputational collapse • Compound crises

← THE GAP — no framework, no system →

Why this gap is dangerous

Single event

Trunk main bursts
in London borough

Cascades into

EA enforcement
Creditor review
Council public letter
Media trending

Threatens

Rescue deal
Regulatory licence
Customer trust
Political support

Acquiring and sustaining resiliency

01 Assess

- Map the system
- Identify dependencies
- Model stakeholders
- Score current readiness

02 Build

- Design playbooks
- Establish escalation protocols
- Configure impact models
- Pre-draft comms

03 Exercise

- Run tabletop scenarios
- Stress-test compound crises
- War-game with leadership
- Validate playbooks

04 Sustain

- Continuous monitoring
- Feedback from every decision
- Model recalibration
- Quarterly posture reviews

Not a one-time project — a continuous operating capability

System overview

INPUTS

Threats
Operational data
Financial position
Stakeholder landscape
External intelligence

RESILIENCY ENGINE

Experience layer
Resiliency advisor
Impact modeling
Scenario planning

*Foundation: org model, dependency map,
stakeholder map, simulation engine*

OUTPUTS

Risk picture
Decision options
Stakeholder strategy
Playbooks
Board reporting

Business architecture

Inputs

Threat scenarios

Trunk main burst, works offline
Sewage spill, creditor withdrawal
Regulator enforcement
Key contractor insolvency

Operational data

Asset condition, failure rates
Workforce capacity
Treatment works performance
Leakage, complaints

Financial position

Debt structure, covenants
Cash runway, funding status
Creditor negotiation state
Insurance, rescue conditions

Stakeholder landscape

Ofwat, EA, DEFRA posture
Creditor consortium stance
Local authority relations
Media sentiment, customer trust

Resiliency engine

Experience layer

- Natural interface for CEO and advisor
- Generates compound crisis scenarios
- Detects weak signals across data feeds
- Rapid cascade analysis
- Drafts multi-stakeholder comms

Resiliency advisor

- Validates which scenarios are credible
- Manages stakeholder dynamics
- Facilitates war-room exercises
- Translates output for board and regulators
- Coordinates under-resourced functions

Impact modeling

- Operational: which services degrade?
- Financial: covenant breach risk?
- Regulatory: enforcement escalation?
- Reputational: trust erosion?
- Compound: how failures interact

Scenario planning

- What-if: creditor pulls out + major spill
- Stress test: breaking point at current staff
- War-gaming with leadership
- Horizon scanning: regulatory, climate, political

Foundation layer

Org and asset model

- Reporting lines, decision authority
- Delegation matrix
- Asset dependency chains
- Key person risks
- Realistic staffing capacity

Dependency map

- System-to-system: SCADA, billing
- Contractor and vendor dependencies
- Financial: debt tranches, facilities
- Regulatory: licence, reporting triggers
- Geographic co-location risk

Stakeholder map

- Regulators: Ofwat, EA, DWI, DEFRA
- Creditors: positions, triggers
- Political: MPs, councils, ministers
- Media: key journalists, velocity
- Customers: 15M+, trust metrics

Simulation engine

- Monte Carlo across compound scenarios
- Agent-based: regulator/media response
- Cascade modeling through dependency graph
- Sensitivity analysis
- Capacity-aware modeling

Outputs

Risk picture

Top compound exposures ranked
Readiness score per scenario
Dependency heat map
Financial stress alongside operational risk

Decision options

Speed vs. thoroughness trade-off
Financial impact — covenant risk?
Stakeholder impact — who pushes back?
Reversibility and precedent

Stakeholder strategy

Regulator messaging: Ofwat vs. EA framing
Creditor confidence management
Political: MP briefings, council coordination
Media narrative and customer comms

Playbooks and board packs

Crisis plans with realistic capacity
Escalation protocols
Board packs: restructuring, audit, risk
Pre-drafted regulatory notifications

Compound crisis scenario

Without BRaaS

CEO reacts to each crisis independently.
Comms contradict. Creditor confidence drops.
Recovery: 6+ months.

With BRaaS

System predicted this cascade. Playbooks pre-drafted. Stakeholder strategy from hour one.
Recovery: weeks.

Execution layer

BRaaS decides what. Existing functions execute. Playbooks built for real capacity.

CISO / Security

Cyber incident response
Access mgmt during restructuring
Threat intel feeds back to engine

CTO / Technology

System recovery and failover
SCADA / OT continuity
Data integrity during crisis

Operations

Field workforce deployment
Backup contractors / mutual aid
Service continuity for 15M+ customers

Legal / Compliance

Mandatory reporting: Ofwat, EA, DWI
Covenant and contractual obligations
Liability and evidence preservation

Comms / PR

Multi-stakeholder messaging
Media response and narrative
Customer and community comms

Feedback loop

A utility managing £16bn+ of debt can't afford a quarterly risk register. The operating reality changes after every burst main, every creditor call, every regulator meeting. BRaaS keeps the model current.

BRaaS

When crises compound, the CEO needs
a system — not a blank page.

- 01** Built for compound crises — financial, operational, regulatory, reputational at once
- 02** Experience layer gives the CEO and advisor a natural interface to the entire system
- 03** Stakeholder strategy is a first-class output, not an afterthought
- 04** Playbooks built for real capacity, not ideal staffing
- 05** Continuous feedback turns resiliency from a project into a capability
